Pilot project overview

A large pipe discharges a thick stream of grey sediment into a marsh field. The sediment is being spread across the marsh, which is covered in tall, dry grasses. The background shows a clear blue sky with a few clouds and a distant horizon line.

❖ **Objective:** Three trial projects to test marsh enhancement through beneficial use of dredged material concept

❖ **Landowner:** NJ DEP Division of Fish & Wildlife

❖ **Funding source:** Hurricane Sandy Coastal Resiliency grant (3-years); USACE and NJDOT dredging funds

❖ **NJDEP Project Team:**

- ❖ Landowner
- ❖ State regulator
- ❖ Wetland ecologists
- ❖ Engineers

A person wearing a white long-sleeved shirt, a tan cap, and sunglasses stands in a wetland field with tall grasses and a small stream. In the background, there are trees and some buildings under a clear sky.

Objectives

Objectives

- ❖ Implement a range of projects on multiple sites
- ❖ Collaborate with other resource agencies to best use limited resources
- ❖ Monitor projects to document success and challenges
- ❖ Disseminate lessons learned to facilitate future projects

Enhancement project goals and assessment

Enhancement project goals:

1. Test the idea that the application of dredged sediment on existing, stressed salt marshes would provide ecological enhancement and help them persist into the future in the face of sea level rise, erosion, and subsidence.
2. Test out a variety of different sediment types, placement methods, and thicknesses on a range of baseline conditions.

Project assessment:

1. Track how the ecology responds initially
2. The methods would be deemed successful if there was
 - a. Return to baseline conditions for all metrics*
 - b. Lasting elevation increase
 - c. More robust native salt marsh vegetation

Fortescue

Marsh pilot: Late winter 2016
Beach: Late winter 2016
Dune: Late winter 2017

Avalon

Marsh demo: Dec 2014 – Jan 2015
Marsh pilot: Nov 2015 – Feb 2016

Ring Island

Marsh demo: Aug. – Sept. 2014
Elevated avian nesting habitat: Aug. – Sept. 2014

Monitoring

- ❖ Vegetation
- ❖ Avian use
- ❖ Elevation and depth of placement
- ❖ SETs and marker horizons
- ❖ Nekton
- ❖ Benthic infauna
- ❖ Epifaunal macro invertebrates
- ❖ Soil properties
- ❖ Wave energy
- ❖ Changes in habitat type (pool, pannes, low marsh, high marsh, dune)
- ❖ Damage cost avoided (HAZUS/CHAMP)
- ❖ Water chemistry
- ❖ Site visits

Ring Island design

❖ Marsh Enhancement

- ❖ Place even 3 of sand on one half-acre plot and 6" in another half-acre plot
- ❖ End of the pipeline containing nozzle placed on a pontoon that can be moved along the marsh edge
- ❖ Due to sandy material, no containment was planned

❖ Elevated Nesting Habitat

Fortescue conceptual design

Stakeholder and community engagement

Stakeholders included on project team or frequent meetings

- ❖ Landowner
- ❖ State and federal regulators
- ❖ Wetland scientists
- ❖ Engineers
- ❖ Dredgers and dredging experts
- ❖ Navigation managers

Community engagement

- ❖ Town council meetings
- ❖ Pre-construction meetings
- ❖ News paper articles
- ❖ Presentation to community at Wetlands Institute

Federal and state policy and permitting

Project	NJDEP Permit	USACE Permit
Ring Island Demo Marsh and Elevated Nesting Habitat	Combined GP29 and AUD; CZM Consistency and WQC.	Not required
Avalon Marsh	2014 Demo Project – GP29 and AUD; CZM Consistency and WQC. 2015 Pilot Project – GP24 and AUD; CZM Consistency and WQC.	Not required
Fortescue Marsh Fortescue Beach Fortescue Dune	Combined GP29 and AUD, CZM Consistency and WQC issued to NJDEP-DFW for habitat enhancement. Combined Waterfront Development Permit. AUD, CZM Consistency, and WQC issued to NJDOT-OMR for the dredging and dredged material placement work.	Combined Individual permit for dredging and habitat restoration issued to NJDEP-DFW.

Depth of placement

Ring Island

- 96% sand
- average depth of placement was 5.9"

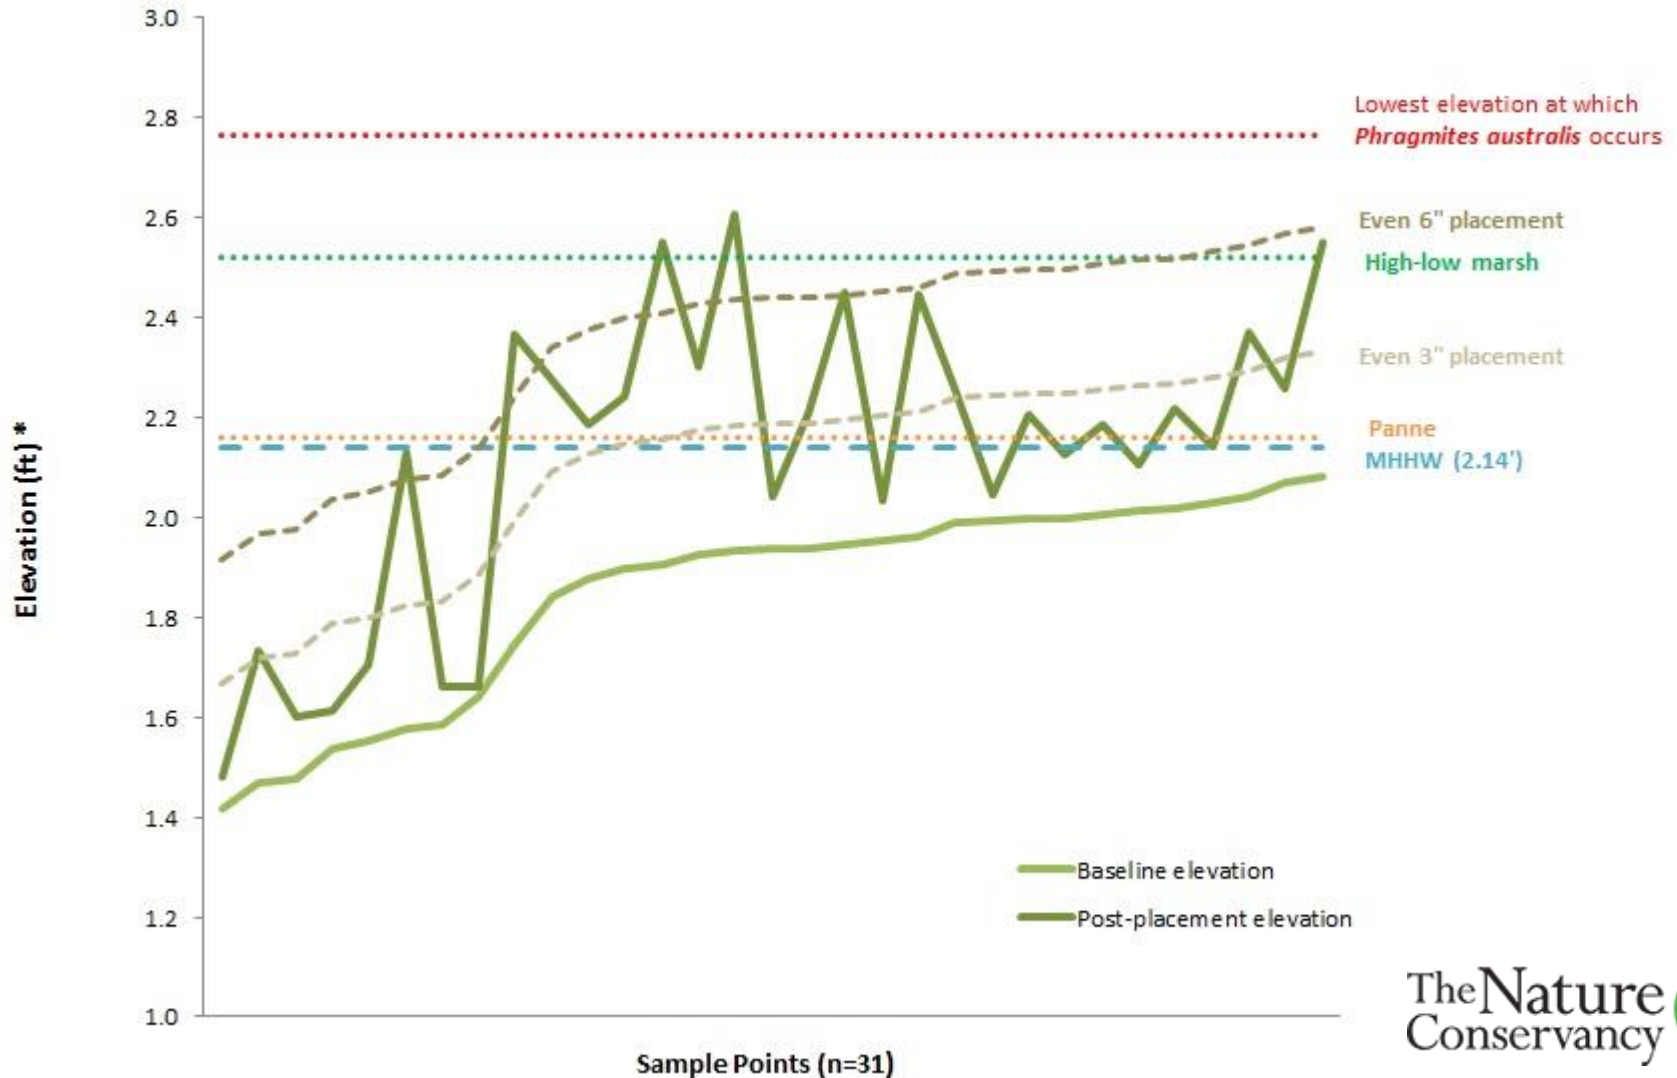

Avalon

- fine-grained silt
- average depth of placement of 9.5" (excluding plots that started as pools)

Fortescue

- silt and sand mixture
- average depth of 6.3"

Ring Island: depth of placement/ elevation

Vegetation

Ring Island

Avalon

Fortescue

Benthic Infauna

Control

Placement

Ring Island
2 years post placement

Avalon
1 year post placement

Fortescue
1 years post placement

Sediments

- Very low organic matter in placed sediments
- Sediments hydraulically sorted as they were placed = low pore space and plating in fine grained sediments
- Too high = too dry = acid sulphate conditions
 - pH < 3.8 in upper 17 cm

Tunstead, NRCS

Design: major lessons learned

- Sandy sediments are not well suited to being hydraulically spread in a thin and even layer on existing marsh
- Selecting proper target elevations is key:
 - bio-benchmarks
 - thinner is better
 - aim lower rather than higher to maintain tidal flushing and reduce need for containment
 - study how channel sediments will dewater and consolidate
- Work with dredging company to design constructible projects
 - distance that sediments can be pumped from channel
 - distance from marsh edge that sediments can be pumped into marsh
- Clearly document as-built goals AND post construction goals

Permitting: major lessons learned

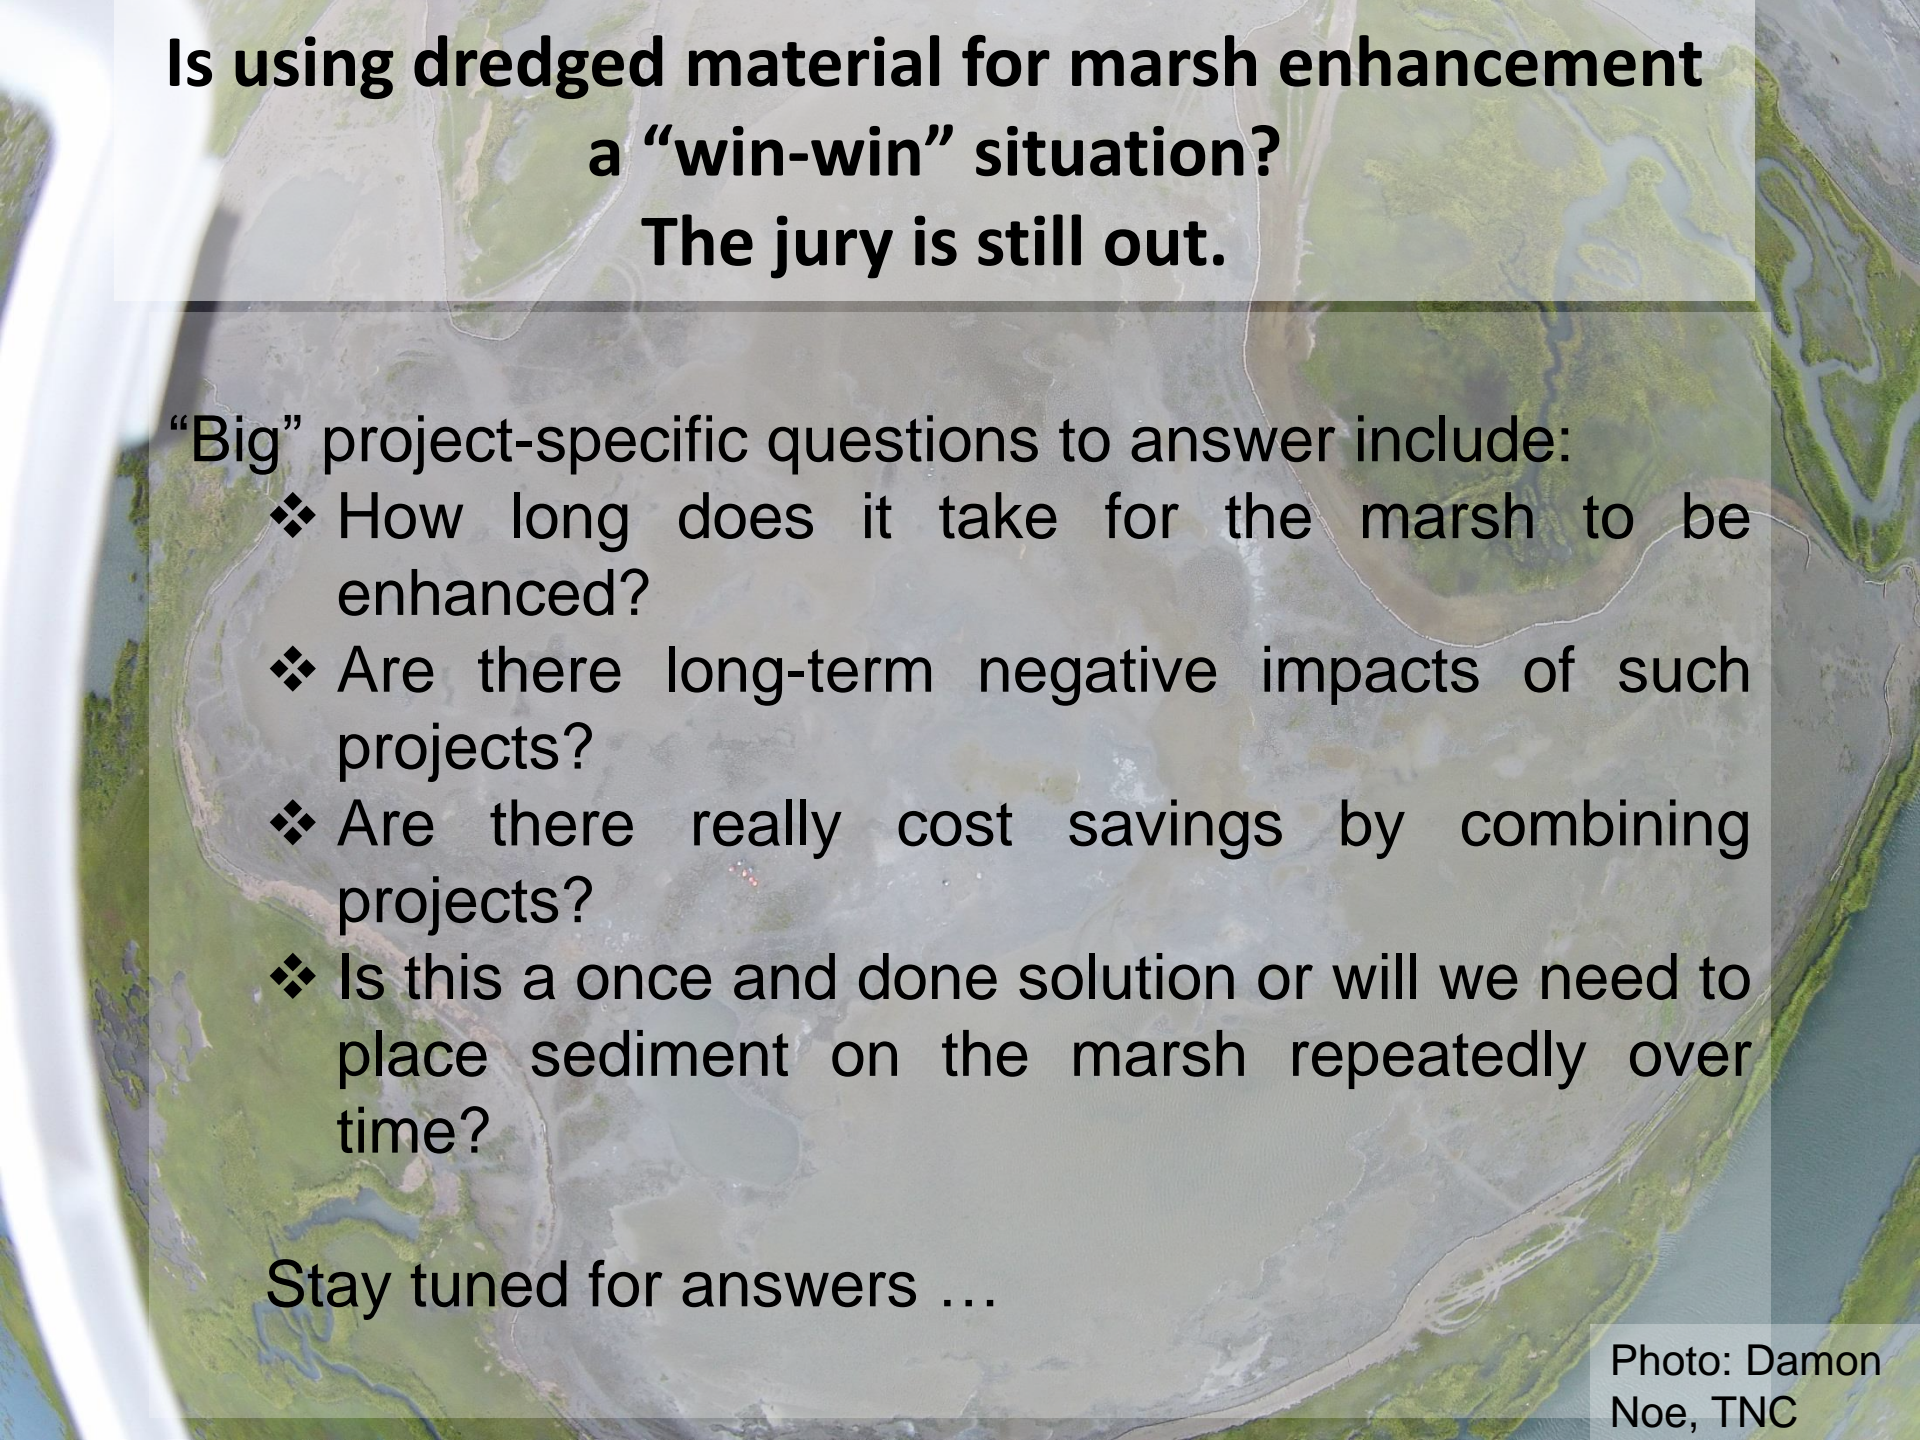

- Involve regulators and landowner as soon and as often as possible in your project to address concerns as they arise
- Get permits in at least 3 months prior to planned construction

Construction: major lessons learned

- It takes longer to construct a marsh enhancement project than either a traditional dredging project or a dune/beach project
- Avoid using machinery (even if low pressure) on the marsh as much as possible
- Plan to remove containment

Monitoring: major lessons learned

- Find funding to monitor for more than 3 years post-construction (5-10 years more likely)
- Include regular site visits with structured qualitative observations (e.g., fixed photo points, condition of containment, etc.)

**Is using dredged material for marsh enhancement
a “win-win” situation?
The jury is still out.**

“Big” project-specific questions to answer include:

- ❖ How long does it take for the marsh to be enhanced?
- ❖ Are there long-term negative impacts of such projects?
- ❖ Are there really cost savings by combining projects?
- ❖ Is this a once and done solution or will we need to place sediment on the marsh repeatedly over time?

Stay tuned for answers ...

Thank you.
